EFFECTS OF AIR BREATHING ENGINE PLUMES ON SSV ORBITER SUBSONIC WING PRESSURE DISTRIBUTION (OA57B)

By T. Soard*

ABSTRACT

The data presented in this report were obtained during wind tunnel tests of a 0.0405-scale model of the -89B Ferry Configuration of the Space Shuttle Vehicle Orbiter. These tests were conducted in the Rockwell International Low Speed Wind Tunnel (NAAL) during the time period of September 18 to September 23, 1973. NASA Space Shuttle test designation was OA57B.

The primary test objective was to investigate orbiter wing pressure distributions resulting from nacelle plumes above and below the wing. Three six-engine nacelle configurations were tested. One configuration had a twin-podded nacelle mounted above each wing and the others had one mounted below each wing. Both had a centerline twin-podded nacelle mounted below the wing. Wing pressure distribution was determined by locating static pressure bugs on the upper and lower surfaces of the left wing. Pressure bugs were also located on the upper and lower surfaces of the body flap and on the B_{12} afterbody fairing when it was installed. Base and balance cavity pressures were recorded and a strain gage instrumented beam in the right wing measured elevon hinge moments and normal forces.

Testing was conducted at 3 ground plane heights (h/b = 0.039, 0.125,

* Rockwell International

and 0.286), with 4 engine pressure ratios (P_{TN}/P_{so} = 0, 1.0, 1.3, and 1.5), with elevon deflections of 0° and -15°, and with body flap deflections of -18°, 0°, and +20°. The nominal angle of attack range was -4° to +20° with an angle of sideslip of 0°. A Mach number of 0.200 was maintained throughout the test.

The model was mounted on a 2.5-inch diameter dummy balance using the W-1052-5 sting and W-1092-A-2 adapter, locating the center of rotation at the trailing edge of the root chord.

This report is presented in two volumes. Volume 1 contains the data figures and Volume 2 contains the tabulated source data.

NOMENCLATURE

Symbol	SADSAC Symbol	Definition
A		area of influence, ft^2
b	BREF	reference span, inches
C_A	CA	axial-force coefficient, axial force/qS
C_{HM}	CHME	hinge-moment coefficient, hinge moment/$qS_E\bar{c}_E$
C_N	CN	normal-force coefficient, normal force/qS
C_m	CLM	pitching-moment coefficient, pitching moment/$qS\bar{c}$
C_p	CP	pressure coefficient, $P_{s\ell} - P_{so}/q$
C.P.		center of pressure
GN_2		nitrogen gas
XCP		distance from MRP to C.P. on X axis, inches
$\bar{c}$	LREF	reference length, inches
h_{WTE}/b	H/B	ratio of height of wing trailing edge above ground plane to reference span
ℓ		distance from MCR to static pressure tap
	MRP	moment reference point
	XMRP	moment reference point on X axis
	YMRP	moment reference point on Y axis
	ZMRP	moment reference point on Z axis
P		pressure, psf
q	Q(PSF)	dynamic pressure, psf
S	SREF	reference area, ft^2
T		temperature, ^oR

NOMENCLATURE (Continued)

α	ALPHA	angle of attack, degrees
β	BETA	angle of sideslip, degrees
γ		ratio of specific heats, $\gamma = 1.4$ for air
Λ_{LE}		leading edge sweep angle, degrees
	CMWING	wing pitching moment coefficient
	CNWING	wing normal force coefficient
δ_e	ELEVON	elevon, surface deflection angle positive deflection, trailing edge down; degrees
ΔC_p	DELCP	incremental pressure coefficient
CA_b	CAB or CAB1	base force coefficient, $\frac{\text{base force}}{qS} - A_b\ (p_b-p_o)/qS$
C_{N_E}	CNE	elevon normal force coefficient
	CPBF	body flap pressure coefficient
	CPBAVE	average base pressure coefficient
	CNTOTL	total normal force coefficient
	CMTOTL	total pitching moment coefficient
C_p	CP	pressure coefficient $(p_1-p_o)/q$
x/c	X/C	local chordwise position/wing chord length
Y/b/2	2Y/B or η	local spanwise position/wing semi-span
	X/L	local chordwise position/reference length
	CNFLAP	body flap normal coefficient
	CMFLAP	body flap pitching moment coefficient
	CNABDY	afterbody normal force coefficient
	CMABDY	afterbody pitching moment coefficient

NOMENCLATURE (Concluded)

P_{TN}/P_o	PTN/P	total nozzle pressure/free stream pressure
R_e	RN/L	Reynold's number, RN/L, millions per foot
δ_{BF}	BDFLAP	flap, surface deflection angle, positive
ℓ_B		body length, inches
	CPSB	base pressure coefficient
	CPSAB	side afterbody pressure coefficient

CONFIGURATIONS INVESTIGATED

The model tested was a 0.0405-scale representation of the Rockwell International-89B Space Shuttle Orbiter. The basic model was of the blended wing-body design utilizing a double delta wing ($75°/45°\Lambda_{LE}$), full span elevons (unswept hingeline), and a canopy. To complete the ferry configuration, air breathing engine nacelles were tested in locations above and below the wing as per SS-A00028. Jet plumes were simulated by exhausting compressed GN_2 from all nacelles.

All model components were per VL70-00089B configuration except for the fuselage lines from station 1307 aft and the engine nacelle groupings and locations.

The orbiter model was constructed of wood and aluminum and was mounted on the Task Corporation 2.5-inch Mk IX dummy balance. The following nomenclature was used to designate the various model components:

Component	Description
B_{16}	-89B fuselage
B_{12}	-89B fuselage with base fairing
C_4	-89B canopy
F_1	Body flap, ATP baseline
J_{40}	Air breathing propulsion system consisting of a twin podded nacelle below each wing and a twin podded nacelle on the lower fuselage centerline
J_{41}	Same as J_{40} except engines under wings extended aft an additional 90 inches full scale

J_{42}	Air breathing propulsion system consisting of a twin podded nacelle above each wing and a twin podded nacelle on the lower fuselage centerline
W_{87}	-89B double delta wing ($75°/45°\Lambda_{LE}$)
E_{18}	Elevon, full span split, used with wing W_{87}

TEST FACILITY

The North American Aerodynamics Laboratory (NAAL) 7.75 x 11.0-Foot Wind Tunnel is a continuous flow, closed circuit, single return type tunnel capable of speeds up to 200 miles per hour. The test section is vented to atmospheric pressure and is 7.75 x 11 feet wide by 12 feet in length. Power is supplied by a 1250 horsepower nacelle mounted synchronous motor driving a 19 foot, seven blade, laminated birch propeller. The airspeed is controlled by varying the degree of coupling between the motor and propeller by means of a magnetic clutch. A damping screen and honeycomb section in the settling chamber upstream from the contraction cone (ratio 7.53 to 1) minimizes turbulence in the test section. The NAAL Wind Tunnel has been in operation since June 1943 and calibrations are available over a wide range of test conditions.

Tests may be conducted using a variety of mounting systems, e.g., a single strut, double strut, sting strut, reflection plane, cable suspension, and two dimensional wall. Aerodynamic data may be measured by a planar type external balance. An automatic data Acquisition System is used to collect, multiplex, digitize, and record 50 channels of force and/or pressure data on magnetic tape. This data is then rapidly reduced and plotted using automatic data processing equipment and an automatic digital plotter.

DATA REDUCTION

Since only pressure distribution and elevon hinge data were required during the test period, the model was mounted on the Task Mk IX 2.5" dummy balance. Therefore no corrections were made for balance and sting deflection. But standard facility corrections for blockage were applied as required. A base and balance cavity axial force coefficient was calculated as presented below:

$$C_{A_{BC}} = -\left(\frac{P_{BC} - P_{SO}}{q}\right)\left(\frac{A_{BC}}{S}\right)$$

and:

$$C_{A_{B1}} = -\left(\frac{P_B - P_{SO}}{q}\right)\left(\frac{A_B}{S}\right),\ P_B = 1/5\ (P_{B1} + .. + P_{B5})$$

Elevon hinge moments and normal force coefficients were calculated in the following manner:

$$C_{HM} = \frac{HM_E}{qS_E\bar{c}_E}$$

where: HM_E = (gage output)x(calib. factor), in-lbs

S_E = Elevon area, ft^2

$\bar{c}_E$ = M.A.C. of elevon, in

and:

$$C_{N_E} = \frac{HM_E}{qS(\bar{c}_E/2)}$$

S = Reference area, ft^2

Static pressure coefficients were calculated as shown below:

$$C_{p_i} = \left(\frac{P_{s_i} - P_{s_o}}{q}\right)$$

Wing $i_{MAX} = 30$

Body flap $i_{MAX} = 3$

Afterbody $i_{MAX} = 3$

where:

P_{s_i} = local static pressure, psf

P_{s_o} = Tunnel static pressure, psf

q = Tunnel dynamic pressure, psf

Wing panel, body flap, afterbody, and total normal force and pitching moment (about 66% body length) coefficients were calculated as presented below:

$$C_N = \sum_{1}^{i_{MAX}} \left(C_{p_{i_l}} - C_{p_{i_u}}\right) \frac{A_{p_i}}{S}$$

where: $C_{p_{i_u}}$ = Upper surface pressure coefficient (assume afterbody $C_{p_{i_u}} = 0.0$)

$C_{p_{i_L}}$ = Lower surface pressure coefficient

A_{p_i} = Area of influence, ft^2, (see tables IV and V for values)

S = Reference area, ft^2

and:

$$C_{m_{0.66\ell_B}} = \sum_{1}^{i_{MAX}} C_{N_i} \frac{\ell_i}{\bar{c}}$$

Where:

l_i = Distance of tap from moment reference point, in, see tables IV and V

$\bar{c}$ = Reference length, in

and:

$$X_{CP} = \frac{C_m}{C_N} (\bar{c})$$

and:

$$C_N \text{ Total} = C_{N_{Wing}} + C_{N_{Body\ flap}} + C_{N_{Afterbody}}$$

and:

$$C_m \text{ Total} = C_{m_{Wing}} + C_{m_{Body\ flap}} + C_{m_{Afterbody}}$$

and:

$$C_m/C_N \text{ Total} = C_m/C_{N_{Wing}} + C_m/C_{N_{Body\ flap}} + C_m/C_{N_{Afterbody}}$$

The following reference dimensions and constants were used in data reduction.

Basic constants:

Symbol	Definition	Model Scale
S	Reference area, ft^2	4.412
b	Reference span, in	37.935
$\bar{c}$	Reference length, in	19.230
S_E	Elevon reference area, ft^2	0.336
$\bar{c}_E$	Elevon reference length, in	3.44

DATA REDUCTION (Concluded)

A_N	Nacelle nozzle exit area, ft^2	0.01278
XMRP	Moment reference point on X axis, in	43.598
XMRP	Moment reference point on Y axis, in	0.0
ZMRP	Moment reference point on Z axis, in	-0.405

Note: Values identical for upper and lower surface

TABLE V. - BODY FLAP AND AFTERBODY PRESSURE CONSTANTS

Body Flap Pressure Constants and Locations

Location	A_{p_i}/S	$\ell_i/\bar{c}$
1	.0170	-1.0399
2	.0160	-1.0399
3	.0170	-1.0399

Note: Values identical for upper and lower surface

Afterbody Pressure Constants and Locations*

Location	A_{p_i}/S	$\ell_i/\bar{c}$
1	.0479	-1.030
2	.0479	-1.191
3	.0479	-1.373

Note: 1. Values identical for side and lower surfaces

2. Assume that all C_p upper = 0.0 for afterbody only

3. Side not utilized for integration

* Afterbody installed during runs 71 and 72 only

Notes:

1. Positive directions of force coefficients, moment coefficients, and angles are indicated by arrows
2. For clarity, origins of wind and stability axes have been displaced from the center of gravity
